Problem Set 3

Conor Twomey Student No. 22996168 Applied Stats/Quant Methods 1

Due: November 20, 2022

Instructions

- Please show your work! You may lose points by simply writing in the answer. If the problem requires you to execute commands in R, please include the code you used to get your answers. Please also include the .R file that contains your code. If you are not sure if work needs to be shown for a particular problem, please ask.
- Your homework should be submitted electronically on GitHub.
- This problem set is due before 23:59 on Sunday November 20, 2022. No late assignments will be accepted.
- Total available points for this homework is 80.

In this problem set, you will run several regressions and create an add variable plot (see the lecture slides) in R using the incumbents_subset.csv dataset. Include all of your code.

We are interested in knowing how the difference in campaign spending between incumbent and challenger affects the incumbent's vote share.

1. Run a regression where the outcome variable is **voteshare** and the explanatory variable is **difflog**.

```
^{1} #1.1 run a regression ^{2} lm1 <- lm(voteshare ~ difflog, data = dat)
```

Table 1:

	Dependent variable:
	voteshare
difflog	0.042***
	(0.001)
Constant	0.579***
	(0.002)
Observations	3,193
\mathbb{R}^2	0.367
Adjusted R^2	0.367
Residual Std. Error	0.079 (df = 3191)
F Statistic	$1,852.791^{***} (df = 1; 3191)$
Note:	*p<0.1; **p<0.05; ***p<0.01

2. Make a scatterplot of the two variables and add the regression line.

```
lm1_plot <- ggplot(dat, aes(difflog, voteshare))+
geom_point(alpha = .2)+
geom_smooth(method = lm)
lm1_plot</pre>
```

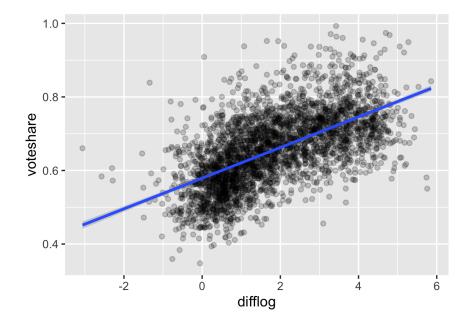

Figure 1:

3. Save the residuals of the model in a separate object.

```
_1 rlm1 <- lm1$residuals
```

$$y = \beta_0 + \beta_1 x$$
$$y = 0.579 + 0.042x$$

We are interested in knowing how the difference between incumbent and challenger's spending and the vote share of the presidential candidate of the incumbent's party are related.

1. Run a regression where the outcome variable is presvote and the explanatory variable is difflog.

 $lm2 \leftarrow lm(presvote ~ difflog, dat)$

Г	Lo.	h]	۸ا	9
	ı a.	IJ.	œ	Δ

	Dependent variable:
	presvote
difflog	0.024***
	(0.001)
Constant	0.508***
	(0.003)
Observations	3,193
\mathbb{R}^2	0.088
Adjusted R ²	0.088
Residual Std. Error	0.110 (df = 3191)
F Statistic	$307.715^{***} (df = 1; 3191)$
Note:	*p<0.1; **p<0.05; ***p<0.01

2. Make a scatterplot of the two variables and add the regression line.

```
lm2_plot <- ggplot(dat, aes(difflog, presvote))+
geom_point(alpha = .2)+
geom_smooth(method = lm)
lm2_plot</pre>
```

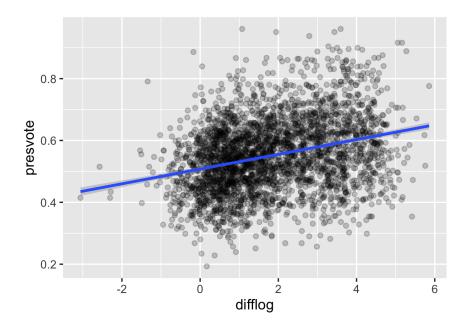

Figure 2:

3. Save the residuals of the model in a separate object.

```
_1 \text{ rlm2} \leftarrow \text{lm2\$residuals}
```

$$y = \beta_0 + \beta_1 x$$
$$y = 0.508 + 0.024x$$

We are interested in knowing how the vote share of the presidential candidate of the incumbent's party is associated with the incumbent's electoral success.

1. Run a regression where the outcome variable is **voteshare** and the explanatory variable is **presvote**.

1 lm3 <- lm(voteshare ~ presvote, dat)

Table 3:

	Dependent variable:
	voteshare
presvote	0.388***
	(0.013)
Constant	0.441***
	(0.008)
Observations	3,193
\mathbb{R}^2	0.206
Adjusted R ²	0.206
Residual Std. Error	0.088 (df = 3191)
F Statistic	$826.950^{***} (df = 1; 3191)$
Note:	*p<0.1; **p<0.05; ***p<0.01

2. Make a scatterplot of the two variables and add the regression line.

```
lm3_plot <- ggplot(dat, aes(voteshare, presvote))+
geom_point(alpha = .2)+
geom_smooth(method = lm)
lm3_plot</pre>
```

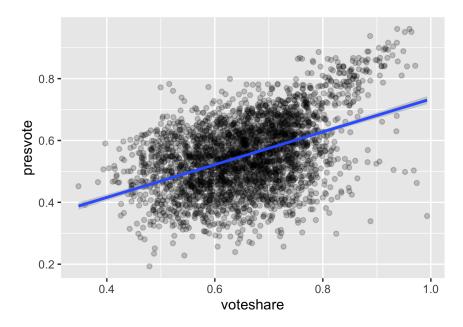

Figure 3:

$$y = \beta_0 + \beta_1 x$$
$$y = 0.441 + 0.338x$$

The residuals from part (a) tell us how much of the variation in **voteshare** is *not* explained by the difference in spending between incumbent and challenger. The residuals in part (b) tell us how much of the variation in **presvote** is *not* explained by the difference in spending between incumbent and challenger in the district.

1. Run a regression where the outcome variable is the residuals from Question 1 and the explanatory variable is the residuals from Question 2.

 $lm4 \leftarrow lm(rlm1 \sim rlm2)$

Table 4:

	Table 4:
	Dependent variable:
	rlm1
rlm2	0.257***
	(0.012)
Constant	-0.000
	(0.001)
Observations	3,193
\mathbb{R}^2	0.130
Adjusted R ²	0.130
Residual Std. Error	0.073 (df = 3191)
F Statistic	$476.975^{***} (df = 1; 3191)$
Note:	*p<0.1; **p<0.05; ***p<0.01

2. Save the residuals of the model in a separate object.

 $_1$ rlm4 <-- lm4\$residuals

3. Make a scatterplot of the two residuals and add the regression line.

```
lm4_plot <- ggplot(aes(rlm2, rlm1), data = dat)+
geom_point(alpha = .2)+
geom_smooth(method = lm)
lm4_plot</pre>
```

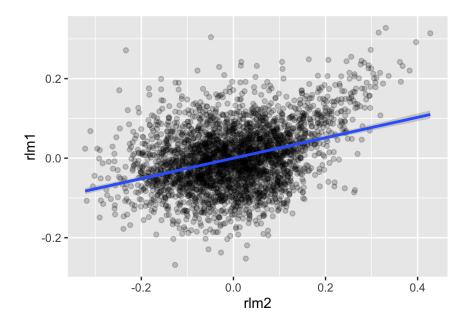

Figure 4:

$$y = \beta_0 + \beta_1 x$$
$$y = 0.000 + 0.257x$$

What if the incumbent's vote share is affected by both the president's popularity and the difference in spending between incumbent and challenger?

1. Run a regression where the outcome variable is the incumbent's voteshare and the explanatory variables are difflog and presvote.

Table 5: Dependent variable: voteshare 0.036*** difflog (0.001)0.257***presvote (0.012)0.449*** Constant (0.006)Observations 3,193 \mathbb{R}^2 0.450Adjusted R² 0.4490.073 (df = 3190)Residual Std. Error F Statistic $1,302.947^{***} (df = 2; 3190)$ Note: *p<0.1; **p<0.05; ***p<0.01

$$y = \beta_0 + \beta_1 x + \beta_2 x$$
$$y = 0.449 + 0.257x + 0.36x$$

3. What is it in this output that is identical to the output in Question 4? Why do you think this is the case?

 $beta_1$ in this output is the same as $beta_1$ in the output in Question 4. In Question 4, we plotted a partial regression. This displays the relationship between the response variable and the explanatory variable after removing the effects of other predictors in the model. So when we examine the effect of voteshare on presvote controlling for difflog, the output is the same.
